

Naeem Dadi

Product-Focused Full Stack Engineer with 5+ years of experience building AI-powered SaaS

naeemdadi85@gmail.com | +91 8866867958 | linkedin.com/in/naeemdadi | naeemdadi.github.io | github.com/naeemdadi

Skills

Languages: TypeScript, JavaScript, SQL

Frameworks: React, Next.js, Node.js, Express, Hapi, GraphQL, React Query, Redux/Redux Toolkit, Tailwind CSS

Databases: PostgreSQL, MySQL, MongoDB, Redis, OpenSearch

Cloud & Infrastructure: AWS, Cloudflare (Workers, KV, R2), Docker, Coolify, Turborepo, GitHub Actions, CI/CD, Better Auth, Sentry

Tools: Prisma, Drizzle, Sequelize, Supabase, BullMQ, Jest, Playwright, Webpack, pnpm, Git, xState, Stripe, Midtrans, SendGrid, Zoom SDK, Zoko

AI & Automation: LLM Integrations, OpenAI API, Azure Document AI, Prompt Engineering, AI Workflow Automation, OCR, Apify, AssemblyAI, Tavily, n8n, Make

Work Experience

Hero Pages

02/2026 – 07/2026 | Remote

Software Engineer (Contract)

- Joined as an **early engineer** on an AI-powered website publishing platform, working directly with the CTO across infrastructure, deployment, and core product features.
- Restructured the platform into a **Turborepo monorepo** with a Next.js app and a dedicated Node.js worker API to support long-running AI workloads (website generation, research, image generation), deploying both via **Coolify/Docker on DigitalOcean**.
- Owned the **Cloudflare Workers/KV/R2 hosting migration** for the platform's AI-generated static sites, moving off a per-site Next.js deployment model — scaling to **225+ live sites, 2M+ requests/month across 130+ regions, 0% error rate, sub-millisecond P50 compute time**.
- Built the **crawl discovery and research enrichment pipeline** — a BullMQ-based discovery system, website briefing intake with JSON validation, and Google Places-based enrichment/geocoding — auto-populating a client's business details from just a URL, cutting website-generation onboarding time versus typing in every field by hand.

Wednesday Solutions

04/2024 – 02/2026 | Remote

Software Engineer II

AI Content Marketing SaaS for Financial Advisors

- Architected a **cross-platform content discovery pipeline** (Instagram, YouTube, TikTok) using Apify and Supabase Edge Functions — replacing a single blocking sync job (timing out past ~77 accounts) with a fire-and-forget, platform-specific webhook architecture, removing the account-count ceiling entirely, plus an AssemblyAI-based transcription pipeline feeding AI script/remix tools.
- Built a **website-intelligence extraction pipeline** that auto-discovers a customer's professional identity from name/email/URL, producing confidence-scored, source-attributed fields that pre-fill an 8-step onboarding form — replacing manual entry of every business detail with a quick review-and-confirm step.
- Led design and delivery of a **seat-based Teams plan** with a centralized, org-wide AI token/credit pool driven by Stripe seat quantity, plus volume credit pricing from \$50 to \$35/credit at scale — including admin/member onboarding, invite-and-seat management, and idempotent renewal logic to prevent double-crediting on subscription events.
- Owned the **subscription lifecycle system**: pause/resume billing on Stripe trial extensions (freezing billing while preserving paid time, instead of cancellation), proration-aware upgrade/downgrade logic, and a platform-wide plan migration (Essentials → Flex) — then closed a **duplicate-subscription race condition** that could double-create active billing records, reconciling it all through Stripe webhook events as the source of truth.

Merchant Offers & Rewards Marketplace (Fintech)

- Identified and **fixed 5 critical authentication vulnerabilities** across a multi-app enterprise platform (Node.js/Hapi API, React dashboard) — including a password-reset token not bound to its OAuth client, which could have allowed cross-account password takeover — closing real account-security and trust risk.
- Led the migration of a Next.js marketplace from **CSR to SSG**, improving **Lighthouse scores from ~30 to 90+** — directly improving page-load speed and SEO ranking on a customer-facing marketplace — while building merchant dashboards and brand-compliant UI with cross-browser E2E test coverage.
- Migrated analytical reporting from MySQL to OpenSearch, reducing dashboard query latency from **20–30 seconds to 5–7 seconds** so operators could act on campaign data in near real-time, while fixing billing-accuracy bugs that were silently under-billing free-trial redemptions and inflating reported totals — protecting revenue integrity.

Software Engineer

- Scaled a veterinary SaaS platform from a single-country product to a **multi-tenant platform across three markets** (Singapore, Indonesia, Hong Kong), redesigning multi-tenancy, localization, and cross-system data assumptions that broke down at scale — while **leading the Hong Kong expansion end-to-end**.
- Designed and led the **digital dispensary platform across all 3 markets** — letting clinics run independent medicine inventory and fulfillment instead of relying solely on the platform-managed pharmacy, including digital prescriptions and bulk stock import — giving the platform a **second monetization channel**.
- Owned the **Zoom-based teleconsultation experience end-to-end** — signature generation, dual join paths (in-app SDK vs. browser), and mobile camera reliability fixes — directly protecting the platform's core revenue path, since a failed video join meant a lost paid consultation.
- Implemented **multi-processor payment infrastructure (Stripe and Midtrans)** across regions including appointment refunds, tax/currency correctness, and system-scoped promo codes, ensuring accurate billing and giving support staff a safe, ACL-controlled refund path without engineering involvement.

eCare Infoway LLP

03/2021 – 09/2021 | Vadodara, India

Frontend Developer

- Developed responsive web applications and custom business websites using JavaScript, PHP and WordPress for multiple clients.

Projects

PR Impact Analysis, *Open-Source GitHub App for AI-Powered Change Impact Analysis*

- Built an open-source GitHub App that performs **deterministic change impact analysis** for JavaScript/TypeScript repositories via a **static dependency graph engine** (framework adapters for Next.js, React Router, Remix, Express, tRPC), identifying affected routes, APIs, and business capabilities without relying on LLM-based dependency inference.
- Designed an **evidence-first analysis pipeline** combining deterministic graph traversal with OpenAI GPT-5.6 over an event-driven architecture (GitHub Webhooks, PostgreSQL, durable background workers), so AI generates only source-grounded PR summaries and verification guidance through sticky PR comments.

Insomanager, *AI-Powered Case Management Platform for German Insolvency Law Firms*

- Engineered the **multi-claim AI extraction pipeline** — the product's core differentiator — combining per-page Azure OCR, an LLM-based page classifier, and a confidence-scored claim-merging engine, turning a single scanned creditor document into multiple structured, verified claims automatically instead of requiring manual entry per creditor — cutting a multi-document intake task down to a single upload-and-review step for case staff.
- Designed a **dedicated extraction microservice from the ground up** (Node/Express, BullMQ/Redis), replacing fragile in-request processing with a durable async job queue and real-time progress via Server-Sent Events, then containerized it with LibreOffice for PDF/Word conversion — eliminating the reliability failures of an earlier serverless-Chromium approach.
- Served as **primary full-stack engineer across both services**, delivering authentication/RBAC, multi-attorney law firm access control, mass-correspondence letter generation (Serienbriefe), case/claims management, debtor finance modules, and consumer/company insolvency workflows, with sustained English/German localization throughout.

Education

Bachelor of Engineering in Mechanical Engineering

2014 – 2017

SVMIT, Bharuch - GTU
